Sequences AAR66244-R66266 are specific examples of such derive. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                  Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive; which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 60

                                                                                          New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                          Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such deriva. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)

ö Bifunctional urckinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such deriva: which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombolytic agents, and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PM field.) 9 61 2 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQIYHAHRSDALQLGLGLGKHNYCRNPDN 1 KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN Gaps /note= "unglycosylated prourokinase(Ser47-Leu411)" 4..85 25..67 fibrinolysis; thrombin inhibition; thrombolytic; anti-thrombotic; urokinase; variant; mutein. 0 100.0%; Score 510; DB 2; Length 392; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, egg for treatment of arterial occlusions, deep vein thrombosis, cardac and cerebral infarction and pulmonary embolism. (Updated on 25-WAR-2003 to correct PN file1d.)

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plaeminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents,
                                                                                                                                                                                                                                                                                                     fibrinolysis, thrombin inhibition; thrombolytic; anti-thrombotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heinzel-Wieland R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; Page 11 and Fig 1; 34pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Steffens GJ, Wnendt S, Schneider J, Saunders DJ;

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)
                                                            fibrinolysis; thrombin inhibition; thrombolytic; anti-thrombotic; urokinase; variant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Steffens GJ, Wnendt S, Schneider J, Heinzel-Wieland Saunders DJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page 10 and Fig 1; 34pp; German.

urokinase variant M12.

(revised)
(first entry)

```
New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR6624-R66266 are specific examples of such derivs. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

New bifunctional urokinase derive and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR65244-R66266 are specific examples of such derives which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombolytic agents, and cerebral infarction and pulmonary embolism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New variants of human prounokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain; (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of hPUK which lacks loops 1 and 2 of the EGF domain; the sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequence after deletion, both of which are given (in Fig 1 and on page 8,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

(ii) at least part of the first loop region of the epidermal growth factor (EGF) domain; (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the same properties as those of hPUK variant and urckinase while retaining the same properties as those of hPUK variant and urckinase while retaining the and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of hPUK which lacks the entire EGF commain; the sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequence after deletion, both of which are given (in Fig 1 and in Fig 2(3),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New variants of human prourokinase (hPUK) comprise a hPUK deficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    15 KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid residues 1-46 contain the EGF region of human urokinase. Deletion of this region results in a plasminogen activator with reduced affinity for liver cell membranes; the mutant protein is not cleared from the circulation as rapidly as is wild-type tPA. The specification only gives the sequence around the deletion and not the full-length sequence of "delta 1-46 urokinase"; the sequence in AAR86854 has been obtained by amending a previously disclosed wild-type human urokinase sequence (from W09501427) according to the description given in Example 3. (Updated on 25-WAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise
                  Human; des-epidermal growth factor homologous plasminogen activator; uPA; liver membrane; reduced affinity; EGF homologous; thrombosis; thrombolytic; increased half-life; urokinase.
                                                                                                                                                                                             'note= "amino acids 1-46 of wild-type urokinase have been
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

AAH32943 to AAH37195 and AAG73514 to AAG7778B represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAH7789 represent sequences used in the exemplification of the present invention. N. B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                             Nucleic acids encoding 4277 human colon cancer-associated polypeptides, useful for preventing, diagnosing and/or treating colorectal cancers.

Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases.

Claim 11; SEQ ID NO 2927; 2922pp; English.

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP41228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also concendences of the invention and polymucleotides 99% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen.

The invention of the invention of the invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen.

The sequences of the invention comprising human ovarian antigen.

The sequences of the invention of the sequence and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic or oplycyptic ovary syndrome, ovarian cystes, and dysmeorichees, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginatory disorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and unimary system disorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndromy and sorders (e.g., chlamydia, HIV, toxoplasmosis, ophoritis and unimary system disorders. Neurological disorders, gastrointestinal disorders of polymucleotides may also be used in screening for compounds which condulate ovarian antigen expression or activity. The polymucleotides may curtain antigen expression or activity. The polymucleotides may confirm any polymosis, drug argeting and phenotyping. The present confirmation of individuals and in forensic analysis, and the confirmation of polymosis, drug argeting and prepare antibodies useful in disease diagnosis, drug argeting and prepare antibodies useful in disease human ovarian antigen of the invention. Note: The sequence data for this patent did neterionic format directly from WIPO certification, but was

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uph). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occludions, thrombotic microrangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 11; Fig 1D; 117pp; English

Human, urokinase-type plasminogen activator, uPA; therapy; hypertension; stroke; hypotension; atherosclerosis; heart attack; thrombotic disorder; uncrovascular occlusion; angiogenic disorder; pulmonary fibrosis; atthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease; adult respiratory distress syndrome; male impotence.

Homo sapiens

40200197752-A2

The invention relates to a composition comprising one or more domains of urckinase-type plasminogen activator (uPA). The composition is used to endothelial cell or tissue. The composition is used to endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, pulmonary fibrosis, asthma, tumour cell andiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory discress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) kringle and Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator. coagulation factor XIIa (EC 3.4.21.38) precursor - bovine (fragment)
NyAlternate names: Hageman factor (activated)
Cipecies: Bos primingenius taurus (cativated)
Cipate: 10-Apr-1995 #sequence_revision 22-Apr-1995 #text_change 21-Jan-2000
Cyaccession: $45281; A61329
Rishibuya, Y.; Semba, U.; Okabe, H.; Kambara, T.; Yamamoto, T.
Rishibuya, Y.; Semba, U.; Okabe, H.; Kambara, T.; Yamamoto, T.
Riceference number: $45281; MUID: 94242782; PMID: 8186251
A; Molecule type: mRNA
A; Molecule to a tresidue 203 as Deu
B; Molecule type: mRNA
A; Molecule to and ATC for residue 505 as Deu

NiAlternate names: tissue plasminogen activator
C;Species tesmodus rotundus (common vampire bat)
C;Date: 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 16-Jul-1999
C;Accession: JS0600
R;Kraetzschmar, J, ; Haendler, B.; Langer, G.; Boidol, W.; Bringmann, P.; Alagon, A.; Don Gene 105, 223-237, 1991
A;Title: The plasminogen activator family from the salivary gland of the vampire bat Des A;Accession: JS0600
A;Molecule type: mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Molecule type: protein

A, Molecule type: protein
A, Residues: $2-27 < Li2>
C, Comment: Plasminogen is converted into plasmin by plasminogen activators, be c; comment: Plasminogen is converted into plasmin by plasminogen activators, be c; comment: Plasminogen is converted into plasmino by plasminogen activators, be activation plasminogen is converted into plasminogen coft the inhibitor, en activation involves also removal of the activation peptide.
C, Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angion of plasminogen treating solid tumors.
C, Punction: alsolves the fibrin of blood clots; acts as a proteolytic fact in a site walls of the graafian follicle; also activates the urokinase-type plasm as the walls of the graafian follicle; also activates the urokinase-type plasm and pathona; in plasminogen-related protein precursor homology companies in angiogenesis inhibitor; blood; tuplication; fibrinolysis; glycopro (F;1-56/Domain: plasminogen-related protein predicted cARD>

of two chains, A and B. The high molecular mass form contains a long chain A. Cleavage occurs after residue 155 in the low molecular mass form to yield a short Al chain.

-!- PHARMACEUTICAL: Available under the name Abbokinase (Abbott). Used in Pulmonary Embolism (PE) to initiates fibrinolysis.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 BGF-like domain.

Submitted (DEC-1986) to the PIR data bank.
-- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-val bond in plasminogen to form plasmin.
-- SIMILARITY: Belongs to peptidase family S1.
-- SIMILARITY: Contains 1 EGF-like domain.
-- SIMILARITY: Contains 1 kringle domain.
-- SIMILARITY: Contains 1 kringle domain.

BOVIN
```

"Bovine urokinase-type plasminogen activator and its receptor: cloning and induction by retinoic acid.", Gene 125:177-183(1993).

SEQUENCE OF 12-433 FROM N.A. TISSUE=Kidney;

Ravn P., Bergjund L., Petersen T.E.;
"Cloning and characterization of the bovine plasminogen activators upA
and tpA.";
Int. Dairy J. 5:605-617(1995).
-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.
-!- INDUCTION: By retinoic acid.
-!- SIMILARITY: Delongs to peptidase family S1.
-!- SIMILARITY: Contains 1 Extrigle domain.
-!- SIMILARITY: Contains 1 kringle domain.
